Owner onboarding checklist

For Keyan FEILI. Use with BTO_CV_Team_Setup.pdf. Verify on one colleague's account before wider rollout.

1. Confirm the release and access

Confirm main contains the intended tested release. The refreshed marketplace manifest is the version authority; compare the installed version with it. Confirm the repository access settings and invite colleagues if needed. Ask them to verify access using their own accounts.

For a personal private repository, collaborators can have write access. The instruction to contact Keyan for shared changes is workflow guidance, not access enforcement. Manage invitations and remove access when no longer needed.

2. Confirm the supported local environment

Use a local Codex environment with command execution and plugin support. Python 3, Git and a plugin-capable Codex CLI must resolve in the hook environment. Verify Git credentials non-interactively. Prefer Microsoft Word for CV rendering on Windows. Required CV fonts are Century Gothic and Wingdings.

The team guide shows the optional Approve for me permission mode. It routes eligible requests to automatic review; it does not guarantee approval or replace sign-in and hook trust. If unavailable or restricted, use Ask for approval.

3. Run the separate-account pilot

Have one colleague follow both pages of the team guide. Confirm all of the following:

Installation: one active BTO plugin is enabled, with version matching the refreshed marketplace plugin.json. Resolve any old standalone copy only after verification.

Updater: the installed hooks/update.py --force --check returns current or updated. Its state in PLUGIN_DATA records ok: true. This proves script success, not lifecycle execution.

Trust and lifecycle: the colleague reviews the current hook definition in a supported review control. Start/resume a new local session and verify the hook ran from the host's hook execution evidence. Recent state may cause a silent throttled run; state alone does not prove a new invocation. If the host provides no evidence, mark lifecycle verification pending.

Document: create the fictional sample in a fresh chat. Inspect editable text, the R.R./A.F.R. banner/layout, native square lists and every rendered page. Each Main responsibilities: label uses 1.5-line spacing; bullets keep their existing spacing.

The team guide can be shared for the pilot. Treat wider rollout as ready only after installation, updater, trusted lifecycle execution and document checks pass on that colleague's machine.

Updates and recovery

Keep the release central and make failures diagnosable without disrupting CV work.

4. Confirm a real version upgrade

At the next tested release, confirm the colleague's trusted hook updates BTO after the daily interval, or test the updater directly with --force --check. Verify the installed version equals the refreshed manifest, then open a new chat. Record lifecycle evidence separately from a forced script check.

5. Handle update failures

A failed check must leave the installed package available. Conversion uses its paired local master and generator; it does not fetch a newer template or require fallback approval. After restoring connectivity/access, refresh and inspect:

```
codex plugin marketplace upgrade bto-cv-marketplace
```

```
codex plugin list --marketplace bto-cv-marketplace --json
```

Compare with the refreshed plugin.json. Only if installation is missing or still behind:

```
codex plugin add bto-cv@bto-cv-marketplace --json
```

Verify enabled status and version again, and start a new chat. If the updater fails, inspect the failing stage, CLI access, Git credentials and interpreter paths. Do not delete credentials, uninstall a working package, bypass hook trust or create another BTO copy.

6. Maintain future releases

Edit the repository, not the installed cache. Preserve the R.R./A.F.R. master and content rules. Run the relevant tests; render and inspect fictional output for formatting changes. Bump plugin.json for package changes, publish the tested release, and keep these guides consistent.

```
python -m unittest discover -s tests -v
```

Current conversion: extract once, reconcile source facts and the complete IT-skills inventory, then use scripts/convert.py to build and structurally verify. Visual review remains separate. Skills intentionally appear under both experience and IT SKILLS; at most four skill groups. Never commit candidate files or private reconciliation data.

Update behavior

SessionStart checks occur at startup/resume, at most once per 24 hours. Failed checks retry no sooner than one hour. This is not a background timer. Package updates need a fresh chat; changed hooks may require renewed trust. Existing CV files are unchanged.
