Set up BTO CV

One-time setup for colleagues. Your local Codex agent handles the technical steps.

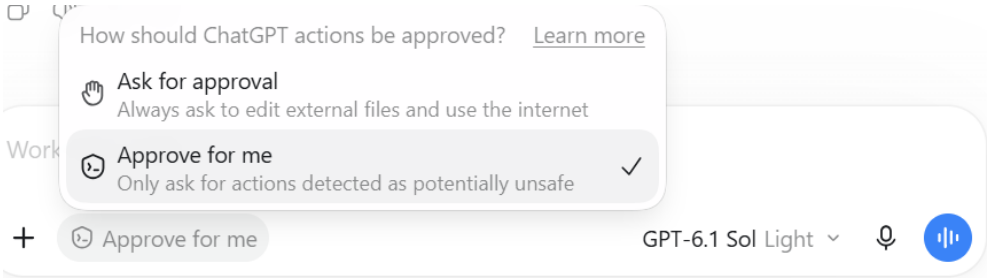
1. Get repository access

Send your GitHub username to Keyan FEILI. Accept any invitation and confirm you can open KeyanFEILI/BTO-CV. Need an account? Use github.com/signup.

2. Open a local Codex chat

Open the Codex desktop app, sign in and start a local chat that can run commands on your computer. Ask Keyan or IT if this option is unavailable.

For fewer setup prompts, click the permissions control below the message box and select **Approve for me**. If unavailable or restricted, use **Ask for approval**.



Eligible actions get automatic review, not guaranteed approval. Sign-in and hook trust still need your input. Menu appearance and model choice may differ.

3. Attach this PDF and send this message

> Set up BTO CV using the agent checklist on page 2. Reuse or update my installation, verify the current version, guide sign-in and hook review, and test a fictional CV. Never ask for passwords or tokens.

4. Complete the setup prompts

Complete GitHub sign-in in the browser and approve any required missing tools. Review and trust the BTO update hook when prompted; installation alone does not trust it.

5. Start a new chat and use BTO CV

After verified setup, start a new local chat, select BTO CV or ask to use its installed skill. Attach your original CV and send:

> Convert this into an editable BTO Word CV. Preserve the facts and wording, except for necessary translation and corrections.

You can also attach a job description for light tailoring. Use only candidate documents permitted by your company. Check the finished CV before sharing it.

Updates and help

Updates are checked at session startup/resume, at most daily. Start a new chat after an update and review the hook again if prompted. Contact Keyan for setup or shared-format changes.

Agent setup checklist

For the local Codex agent. The user explicitly requests these steps by sending the setup message on page 1.

1. Check access and tools

Reuse Python 3, Git and a plugin-capable Codex CLI. Install missing tools only with the user's approval. Verify non-interactive Git access to the repository; browser sign-in alone is not proof. If authentication is needed, guide the user through the supported browser flow. GitHub CLI is optional. Never request or print credentials.

2. Register, refresh and verify

Inspect existing marketplaces and installations first. Reuse the BTO Git source tracking main. If absent, register it:

```
codex plugin marketplace add https://github.com/KeyanFEILI/BTO-CV.git --ref main
```

```
codex plugin marketplace upgrade bto-cv-marketplace
```

```
codex plugin list --marketplace bto-cv-marketplace --json
```

Read plugin.json at the refreshed marketplace root. The installed BTO version must match that manifest and be enabled. If missing or still behind, install/refresh and verify again:

```
codex plugin add bto-cv@bto-cv-marketplace --json
```

This guide was checked against v3.4.1; use the current refreshed manifest, not a fixed minimum version. Preserve any old standalone skill until the plugin works, then resolve duplicates with the user.

3. Verify the updater and hook trust

Locate the verified installed plugin root. Ensure its hook environment resolves python on Windows (python3 elsewhere), Git and Codex; BTO_CODEX_BIN can specify the CLI path. Run the updater using that installed root:

```
python "<installed-plugin-root>/hooks/update.py" --force --check
```

Use python3 where appropriate. The command performs an update check; current or updated means success. A failure is not a verified setup. Guide the user through the supported hook review; never bypass trust. In a new local session, verify actual SessionStart execution. A direct script run alone does not prove that the trusted hook fired; a daily-throttled hook may be silent.

4. Test in a fresh chat

Generate an editable Word CV from the installed examples/sample-cv.txt. Verify source facts, native square bullets and every rendered page. Prefer Microsoft Word on Windows; the CV requires Century Gothic and Wingdings. Report missing fonts or incomplete visual review. Use the template and generator from the same installed release; no template download is needed during conversion.

Report installed version, enabled status, updater result, hook verification and sample-CV result separately. If hook execution or a required check cannot be verified, explain the remaining step and contact Keyan; do not claim full setup success.
